UltraSeal

UltraSeal..... Efficiency plus!

Premier Integrated Technologies has a series of plungers which offer the most advanced sealing mechanisms on the market today. The key to the success of the UltraSeal Plunger is a HNBR™ rubber seal attached to the body of the plunger between interlocking tabs under the pads. The interlocking pads serve as a protector to the UltraSeal which decreases gas slippage under the pads. The result is less fluid “fallback” during the plunger cycle to the surface which means the plunger requires less gas pressure to make the run. This product is a patented product to the IPS/ PIT team and has shown great results in all tests.

- **Patented design with many applications**
- **Better lift than a standard dual pad**
- **Shorter & Lighter = No port restriction, comes all the way up more often**
- **Collapses smaller to get through tight spots**
- **Cost Effective**

Take the Challenge!

Try the UltraSeal out for a comparison test against current plunger models.
